SUMMARY	9

Introduction

Through Cooperative Agreement #W912DY-07-2-0005, the Center for Plant Conservation (CPC) partnered with the Department of Defense (DoD) to evaluate the status of ex situ (off-site) seed-banked material of DoD special status species. This information was developed to assist the management of native plants of those species deemed by the DoD to be vulnerable.

Ptilimnium nodosum (Harperella)

CPC coordinates the National Collection of Endangered Plants. The National Collection is a multi-partner effort of 36 CPC participating institutions and others to secure ex situ material of the nation's most vulnerable species. These are stored in seed banks or genetically-managed collections for use in efforts to restore these species in the wild. CPC's ex-situ conservation objective is to appropriately seed bank all plant species with a NatureServe conservation rank of G1-G3. A G1 ranking indicates that a species is at very high risk of extinction and has ~5 or fewer populations extant worldwide. A G3 ranking indicates that a species is vulnerable to extinction and has ~20-100 populations extant worldwide.

Seed banking the nation's species of conservation concern is a vital activity, and CPC has demonstrated that ex situ collections can be made and secured very cost-effectively using public-private partnerships. Ex situ collections maximize the options for conserving biodiversity and for management and restoration of species as we face the challenges of climate change. CPC has expertise in procedures for collecting and managing viable ex situ seed collections in long-term storage for later use in restoration or recovery work. CPC protocols (Appendix 1) call for the collection of genetically representative samples in a manner that is appropriate for small and fragile populations and does not degrade reproductive capacity in the wild. For example, in very small populations, CPC will collect only small samples in repeated years to achieve the best genetically-representative sample.

CPC has also developed and is improving a central, national database of ex situ materials of imperiled species of the United States. This database is dedicated to supporting efforts

to secure and restore the nation's most imperiled species. CPC uses the database in planning, to develop internal priorities and to help conservation partners by making the information available. Information about the accessions in the National Collection is not publically available or displayed on the CPC website. Locality information is not shared without explicit permission.

This report provides a resource that identifies DoD special status plant species with ex situ material available for conservation and management. It also provides individual DoD services and installations the ability to better examine the status of efforts in securing the genome of vulnerable species against further decline in the wild. It will give DoD the capacity to review preparedness in implementing needed restoration efforts using augmentation or reintroduction techniques. This report will serve as a vital tool in setting priorities, budgets, and planning for any future ex situ work on DoD special status plant species.

Approach

The evaluation used a survey and central-reporting based approach to gather information about individual species' ex situ resources that have been secured. The survey requested information on collections from sites on DoD lands and other nearby public and private lands. This gives DoD a comprehensive picture of genetic resources available to meet conservation and restoration challenges for the special status species list provided to CPC by DoD. The CPC National Office queried its database for records of DoD special status species. Twenty-six of CPC's participating institutions (arboreta, universities and gardens part of the CPC network recognized for their conservation efforts) conduct work in the areas of occurrence of the species on the DoD list. The CPC National Office engaged 26 PIs located throughout the United States in updating existing information and adding new information to the database for these species. We requested that PIs gather information about any collections that they might be aware of residing outside the CPC network. In addition, DoD published a request for information about known ex-situ collections in the DoD Legacy Program Natural Selections Newsletter, asking installation environmental staff to participate in submitting accessions.

An accession equals a discrete collection of seed or other propagules in storage. Plant materials in cultivation (derived from wild material) generally include all plants from one population in a single accession, but there are some exceptions where PIs track individuals to facilitate managing maternal lines separately.

Agalinis auriculata (earleaf foxglove) seeds

Generally, the accessions reported represent seed collected from wild populations currently in a seed bank at the institution or on deposit under CPC's agreement with the USDA-ARS storage facilities in Fort Collins, CO. The vast majority of these accessions are field-collected material. Less than 3 % of these accessions are from propagated material.

In some cases accessions are whole plants (*Malacothamnus clementinus*, *Schiedea hookeri*, etc), cuttings (*Monardella linoides* ssp. *viminea*, *Neraudia ovata*, etc), tissue culture (*Hedeoma todsenii*), spores (*Pteris lidgatei*) or seeds collected from F1 generation of plants (*Lithophragma maximum*, etc) growing in CPC institutions. In some cases tissue culture plants or cultivated plants have been the only viable option for maintaining ex-situ material of some tropical species that do not tolerate cold storage well (recalcitrant seed). This has limited the ability to secure ex situ collections of tropical species. However, recent advances in seed storage research at the USDA-ARS facility in Fort Collins have revealed new seed lipid structures. Understanding the nature of these compounds and their behavior in storage has led to new potential for storage of these materials formerly regarded as recalcitrant. These species can now be successfully stored for many years using cryopreservation techniques.

Collection Coverage

The DoD special status species list provided to CPC included 185 species. Approximately 33% (61 of 185) of all DoD special status plant species currently have no known collections of any kind (Table 1, Appendix 2). CPC participating institutions (PIs), the Oahu Army Natural Resource Program (OANRP), and the Pohakuloa Training Area (PTA) have secured material from sites on DoD lands for 54 species or 29% of the DoD special

status species list (Tables 2 and 3, Appendix 2). Although, several species (*Cyrtandra subumbellata* *Euphorbia haeleeleana*, *Labordia cyrtandrae*, *Lobelia oahuensis*, and *Platydesma cornuta* var. *decurrens*) are still in the testing phase of determining appropriate propagation and storage techniques and, therefore, are not necessarily part of a permanent collection (Table 3, Appendix 2). For fifteen of these 54 species (*Asplenium fragile* var. *insulare*, *Astragalus jaegerianus*, *Castilleja grisea*, *Haplostachys haplostachya* var. *angustifolia*, *Hedyotis coriacea*, *Lipochaeta tenuifolia*, *Lobelia gaudichaudii* ssp. *koolauensis*, *Lotus dendroideus* ssp. *traskiae*, *Phyllostegia hirsuta*, *Portulaca sclerocarpa*, *Pteris lidgatei*, *Silene hawaiiensis*, *Tetramolopium arenarium*, *Viola oahuensis* and *Zanthoxylum hawaiiense*) the only ex situ materials secured are those from DoD lands.

Sixty-nine species (37%) have ex situ material secured, but the existing collections are from sites outside of DoD lands (Tables 3 and 4, Appendix 2). There are 107 species with accessions from sites on non-DoD land (38 of these species have accessions from DoD lands as well). In total, the CPC currently holds material for 100 DoD species (with 1,573 accessions) (Table 4, Appendix 2). Another 24 species are held at the storage facilities of OANRP and PTA (Table 3, Appendix 2). Those species with the best coverage for future plant material needs are those with both collections from the DoD sites and material from other nearby sites as well.

Collecting *Spiranthes diluvialis* (Ute ladies'-tresses) seeds

Table 2 (Appendix 2) summarizes ex situ accessions from DoD land by species and provides detailed information about the species and ex situ accessions that exist. The table includes, by species, the collection date, installation, propagule source and count, heritage

program element occurrence number (EO), and collection state and county. Table 4 (Appendix 2) summarizes all CPC ex situ accessions from all landowners by species. The table includes the collection date, landowner, propagule source and count, storage location, heritage program element occurrence number (EO), and collection state and county. The spreadsheets will be made accessible on the Defense Environmental Network and Information Exchange (DENIX) website (www.Denix.osd.mil). Users may also query the CPC National Office if they have additional questions.

DOD Seedbank Species at US Army O`ahu Natural Resources Office

As part of the CPC effort to identify other seed storage activity, we contacted Lauren Weisenberger at the US Army O`ahu Natural Resources Office. Lauren is coordinating efforts to secure and store seed of Hawaiian species needed for DoD restoration efforts in the islands at a dedicated DoD facility. Lauren provided information about accessions acquired as part of the Makua Implementation Plan. Lauren reports that she has begun work on an additional project that has added accessions of more species. Lauren agreed to provide information about all current species with accessions, but was unable to provide it in the format requested for this report. Consequently, we include this information as a separate table (Table 3, Appendix 2). Lauren additionally provided a list of species with accessions at the PTA via a representative at the PTA.

Collection Quality – Age

Viability of seed in long-term storage varies by species. Accessions more than 10 years of age are at a greater risk of having lower germination rates (low viability rates) than more recent collections. Managers should monitor the age of ex situ material available and be prepared to replenish seed when necessary. Replenishment of stored seed material would include recollection (if wild populations are still in good condition) or planting out to produce a new genetically-managed seed crop (when wild collections are not available or have declined in numbers or vigor).

In general, most DoD collections should still be viable. Only twenty-three percent of the 208 DoD accessions were collected before Jan. 1, 1999, but some older collections were made more than 25 years ago (Table 2, Appendix 2). For example, *Malacothamnus clementinus* has a few of its accessions made in the late 1960s and several others made in the 1980s – 1990s. *Astragalus jaegerianus*, *Delphinium variegatum* ssp. *kinkense*, *Lotus dendroideus* ssp. *traskiae*, *Malacothamnus clementinus*, and *Phyllostegia hirsuta* were all collected pre-1998. The age profile of the total number of accessions is similar to that of the accessions from DoD sites. Out of the 1,573 total accessions, on both DoD lands and non-DoD lands, eighty percent of them have a collection date in the last ten years.

Collection Quality – Representation

Having ex situ collections available from multiple sites across the species range is important in restoration. Genetically representative collections from as many separate

populations as possible will increase options for best matching of genetic material needed for restoration work.

For population restoration, in most cases, using material from the original site is preferred. However, genetic processes such as inbreeding or outbreeding depression may require use of material from other populations to restore vigor in a given locality. Reintroduction strategies include reviewing habitat characteristics of a proposed site and matching source material population's habitat to the target restoration site. Introduction into a new location with suitable habitat or best available habitat, may involve mixing several population sources to create material that is both genetically robust and adapted to the conditions at the site. When ex situ collections represent fewer populations relative to the number of known populations, the ability to use the best adapted material is reduced. This may result in a more complicated, longer and more expensive restoration plan to re-establish the species in a given site.

Over thirty-five of the DoD species accessions have collections made from only one population. For example, *Castilleja grisea* has collections made from only one element occurrence on San Clemente Island, NALF, while the species is known from approximately 40 element occurrences.

Collecting *Castilleja levisecta* (golden paintbrush) seeds

Recommendations

Given the results, the Center for Plant Conservation recommends that DoD consider the following:

1. Expand ex situ collections to include long-term storage of special status plant species occurring on DoD lands. Collection from populations of these species on DoD lands should be a priority to maximize restoration potential and preparedness. Collections should be prioritized based on level or potential for disturbance by training or operational activities.

2. Improve coverage of ex situ collections across all populations, particularly the populations closest to DoD lands, regardless of ownership. Some of these populations on adjacent lands may be extremely significant to future DoD restoration work. Collections of materials from these nearby populations, especially where site characteristics are compatible, may be the only option to augment or restore DoD populations that are small or have been extirpated. Partnering with other public agencies and organizations to ensure ex situ collections of nearest neighbor populations would be cost-effective.
3. Continue to monitor age and viability tests for ex-situ materials. Recollect/rejuvenate aging collections for those species where tests show seed germination is beginning to decline (which indicates a loss of seed viability). The maintenance of these collections is critical in maintaining future restoration options for managers and should be a high priority. Rejuvenation of stored seed collections should be undertaken carefully in genetically managed conditions designed to preserve as much of the wild variability in the original seed sample as possible. Such efforts would involve balancing the representation of seed produced by individual maternal lines in replacement seed deposits and recording the mortality of seed grown from the original wild sample.

Summary

In summary, DoD lacks preferred site-specific material from their own populations for 130 of their special status species (71%). The CPC currently holds material for 100 DoD species (with 1,573 accessions) and another 24 species are held at the storage facilities of OANRP and PTA. These accessions could provide helpful material in some restoration situations. Of 185 special status species evaluated, 61 species (34%) have no known collections secured. Ex situ material from DoD sites is secured for only 54 (29%) of these species. Sixty-nine species (37%) with material secured are from non DoD sites. This low number of species that has ex situ material secured would limit DoD's ability to conduct population level restoration, particularly augmentation or reintroduction work, which may be necessary to fulfill DoD's mandate to manage and restore these species on DoD lands.

Information about ex situ resources of target species collected from non-DoD lands is also important in planning for DoD conservation and management. In many cases non-DoD populations may be in close proximity to DoD lands and would be suitable and valuable in selecting material for restoration if DoD populations are lost. In addition, if DoD populations show characteristics of degraded genetic conditions, these may be reversible by restoration activities using some material from appropriate nearby populations

Given the benefits to conservation, restoration and management of special status plants on DoD lands, the Center recommends that DoD include seed collection (or where necessary tissue collection) efforts in future planning for management needs for these species.

Given the expected stresses on native plant communities and small populations (including most special status plant species) as a result of climate change, the priority for ex situ efforts to secure this material is urgent.

The Center for Plant Conservation shares concern about these species and a mission to work actively through our network to conserve and restore them. CPC may be able to work cooperatively in this effort to make the work as efficient and cost-effective as possible and to ensure that seed are collected, handled and stored using best conservation practices.

Appendix 3.

Center for Plant Conservation Participating Institution Abbreviations

AMY	Amy B. H. Greenwell Ethnobotanical Garden
FLAG	The Arboretum at Flagstaff
BERR	Berry Botanic Garden
BOK	Bok Tower Gardens
BBG	Brooklyn Botanic Garden
DES	Desert Botanical Garden
FTG	Fairchild Tropical Botanic Garden
LYON	Harold L. Lyon Arboretum
MBG	Missouri Botanical Garden
NTBG	National Tropical Botanical Garden
NEWF	New England Wild Flower Society
NY	The New York Botanical Garden
NCU	North Carolina Botanical Garden
SABG	San Antonio Botanical Garden
SBBG	Santa Barbara Botanic Garden
RSA	Rancho Santa Ana Botanical Garden
RED	Red Butte Garden and Arboretum
BERK	University of California Botanical Garden
UW	University of Washington Botanic Garden
WAI	Waimea Valley Audobon Society
